

SIMPLE SILICONE

Simple Silicone is an easy to use silicone putty. To use Simple Silicone take equal parts of each the white and green parts and roll into balls. This makes it easy to see that both parts are of equal size.

Now mix the balls together and kneed vigorously. Squeeze then fold, squeeze, then fold over and over. This takes about 30 seconds. What you in the end is a mass all the same color, a mint green. If you see any light or dark spots you need to keep mixing.

Once mixed, simply place the silicone over the item you are going to make a mold of. If it has deep recessed areas it's a good idea to take small amounts of the silicone and push it into those areas first. Simple Silicone is very soft once mixed, so it's a good idea to place the item being molded on a flat surface, face up and place the silicone on top. This way the silicone won't droop away from the item while curing. When cured, simply pop your original item out of the silicone mold and it's ready to use.

FAQ

- 🕒 Working time of Simple Silicone is 5 minutes
- 🕒 It takes 15 minutes to fully cure once mixed
- 🕒 Silicone does not require any release agent
- 🕒 Simple Silicone has a one year shelf life in it's 2 part state
- 🕒 Simple Silicone is FDA approved for food contact

Simple Silicone molds can be used for the following items:

- ☀️ Epoxy resin
- ☀️ Polymer Clay (as a push mold)
- ☀️ Wax
- ☀️ Soap
- ☀️ Chocolate
- ☀️ Hard Candy
- ☀️ Low Melt Metals
